

While this course is an introductory course, it will not be enough for you to become a data scientist. However, you now know that Stata will make your life easier and more exciting as you work on your data skills. Feel free to email me with any questions or concerns you may have. I would also love to have your feedback on this course. Hopefully, once I publish my second course, I will see you there to. My plan is to publish several courses where each course deals with a different tool.

There are many resources for those who are interested in learning Stata. Fortunately, Stata Press regularly published excellent books that teach you both the statistics and how to apply them in Stata. One of the first books that I read, and which proved to be really helpful was *Statistics with Stata* by Lawrence Hamilton. This is an excellent book for learning and for keeping next to you as a reference.

Another excellent book that is dedicated to data management in Stata is *Data Management Using Stata* by Michael Mitchell. Finally, a great book to start learning statistics with Stata is *A Gentle Introduction to Stata* by Alan Acock.
